### **DETAILED ACTION**

## Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on March 1, 2004 has been entered.

# Drawings

The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the modulation of the refractive index material must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Art Unit: 2873

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Portney (US 4,898,461). Portney teaches a method of manufacturing a multifocal lens by depositing on at least a portion of a surface of a lens substrate at least one layer of a surface forming amount of a refractive index material where the material is deposited under conditions suitable so that the material forms on the lens substrate surface a near vision zone, an intermediate vision zone or a combination (Fig. 7; col. 6, line 41-col. 7, line 10). Portney does not specifically teach that the refractive index material can be high index. However, Portney does teach that the index of refraction is directly proportional to the ion concentration per cm3 (col. 6, lines 62-64). It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a high index material as the layer material in the lens of Portney, since the powers of the multifocal lens is a function of the prescriptive requirements of the wearer and the powers being a function of the index (the ion concentration). Portney does state that a layer of increased index of refraction is produced (fused quartz with nitrogen ions or other elements) (col. 6, lines 59-62). The material can form the near and intermediate zones (col. 5, lines 27-33) and over the entire surface of the substrate (see Fig. 7). The

Application/Control Number: 10/003,991 Page 4

Art Unit: 2873

material can be fused quartz with nitrogen ions or other elements (col. 6, lines 59-62). The deposition can be a refractive index modulation or refractive index gradient (col. 6, lines 52-55). Although Portney is not required to meet the limitation "capable of" since this is not a positive recitation of means or function, the surface of Portney is also capable of correcting at least one higher order aberration.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Scott J. Sugarman whose telephone number is (571)272-2340.

The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
